

Sophos Switch

Connectivity, management, and control at the all-important access layer

The Sophos Switch series delivers a range of gigabit and multi-gigabit network access-layer switches to seamlessly connect and power the devices on your LAN. Sophos switches suit the connectivity needs of many organizations: remote and home offices, small and medium-sized businesses, retail outlets, and branch offices.

Use cases

1 | NETWORK VENDOR CONSOLIDATION

Desired outcome: A holistic approach to wired and wireless networking.

Solution: Having network infrastructure from multiple vendors makes security management unnecessarily complex, slows down troubleshooting, and can increase costs. Add Sophos Switch and Sophos Wireless to an existing or new Sophos Firewall deployment to consolidate key network infrastructure and optimize day-to-day security management and operations.

2 | MULTI-GIGABIT CONNECTIVITY

Desired outcome: Eliminate network bottlenecks with higher bandwidth and lower latency.

Solution: Sophos multi-gigabit switches offer a future-proof solution to avoid network bottlenecks. As bandwidth demands soar, traditional gigabit Ethernet struggles to keep up. Sophos multi-gig connectivity across your firewalls, access points, and switches provides the necessary throughput to handle evolving connectivity requirements, enabling you to confidently scale your operations and support emerging technologies while maintaining a high-performance user experience.

3 | POWER-OVER-ETHERNET

Desired outcome: Provide a power source for connected devices at the LAN edge.

Solution: Power over Ethernet (PoE) - capable switches provide power and connectivity at the all-important access layer, without the need for extra cabling to install additional power sockets. Our switches can power a range of different devices from POS systems and PoE-capable printers, to access points and IP cameras. Particularly in retail, where space is often limited, a switch that can power multiple devices can be a simple, space-saving option to provide reliable connectivity.

4 | STREAMLINED MANAGEMENT

Desired outcome: Focus on threats instead of administration.

Solution: Sophos Central is a cloud-based, AI-native cybersecurity management platform that unifies all Sophos next-gen security solutions. By using a centralized management solution, you reduce the number of consoles your IT security team need to observe, while also unlocking additional cross-product functionality, such as Active Threat Response, to trigger an automatic response to isolate compromised hosts across all Sophos switches and AP6 Series access points on the network.

The purchase price includes a Limited Lifetime Warranty and access to the local user interface, SNMP, and CLI management.

A support subscription per switch unlocks Sophos Central management and features, firmware updates, advanced RMA, 24x7 multi-channel support.
